```
The invention relates to a method of identifying biologically active small molecules that specifically bind a transcytotic molecule or a polyimmunoglobulin receptor (pigR) target molecule. The method involves contacting candidate small molecules with at least 1 transcytotic contacting candidate small molecules with at least 1 transcytotic molecule or comprising the transcytotic molecule or pigR target molecule and a small molecule can form, and identifying the small molecules present in the complexes. The methods and compositions of the present invention are used complexes. The methods and compositions of the present invention are used for identifying, characterising, distinguishing, derivatising, optimising and using compounds that are or comprise a ligand that binds a pigR molecule used for therapeutic and prophylactic applications, particularly in vaccination and in diseases where a protective immune response is needed or in diseases such as cancer, asthma, pathogenic infections, allergies, Crohn's disease and eating disorders. The present sequence is conserved pigR peptide. (Updated on 06-NUG-2003 to correct OS field.)
Identifying small molecules that specifically bind a transcytotic or pIgR target molecule, useful for treating and/or preventing disorders such as cancer, asthma, pathogenic infections, allergies and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Transcellular transport, transcytotic transport, paracellular transport, respiratory system disorder; lung cancer; tumour; asthma; pathogenic infection, allergy-related disorder, gastrointestinal tract disorder; gastrointestinal tract disorder; chron's disease; eating disorder; polyimmunoglobulin receptor; plgR.

Homo sapiens.

```
The invention described a complex or compound (I) comprising a biologically active portion and a target element (II) directed to a light that confers transcellular, transcyctic or paracellular transcyctic or paracellular transcyctic or paracellular transporting properties to an appetifically bound to the ligand, where (II) is not an antibody. Alternatively, (I) comprises two or more (II) is not an antibody. Alternatively, (I) comprises two or more biologically active agent to an animal, (or transporting an active agent trough an epithelial or mucosal barrier, and for treating or identifying a disease in an animal e.g. diseases of the respiratory system including lung cancer and tumours, asthma, pathogenic infections, allergy-related disorders, gastrointestinal tract disorders, disorders relating to gastrointestinal hormones, Chron's disease, eating disorders and any displaying cells. This sequence represents a peptide associated with the transport of biologically active agents across cellular barriers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transepithelial transport; membrane bound vesicle; virion; liposome; envelope; capsid; transmembrane domain; gene therapy; immunostimulant; cytostatic; haemostatic; neuroprotective; antirheumatic; antiarthritic; antiloacterial; anti-HIV; hepatotropic; virucide; exocytosis; antiluflammatory; apical endocytosis; basolateral endocytosis; basolateral endocytosis; basolateral endocytosis; Als; transcytosis; monogenic disease; AbA deficiency; oystic fibrosis; ALS; X-linked severe combined immunodeficiency; Haemophilia B; cancer; HIV; chronic granulomatous disease; coronary artery disease; viral infection; amportophic lateral sclerosis; rheumatoid arthritis; hepatitis; Herpes; pathogenic disorder; human immunodeficiency virus; bacterial infection; tuberculosis; Chlamydiosis; gastrointestinal ulcer; human pigR;
                                                                                                                                                                                                                                                                                                                                                                              Complex useful for transporting active agent through epithelial barrier, has biologically active portion and target element directed to ligand that confers e.g. transcytotic properties to agent specific to ligand.
                                                                                                                                                                                                                                                                                               Basu A;

The present invention describes a fusion protein (I) comprising a transepithelial delivery element (TDE) from a first protein and a transmembrane domain from a second protein, or comprising TDE and a viral sequence that confers the ability to be associated with or incorporated into an envelope or capsid protein of a virus. (I) has immunostimulant, cytostatic, haemostatic, neuroprotective, antirheumatic, antiarthritic, antiinflammatory activities, and can be used in gene therapy. (I) confers the ability to undergo apical endocytosis, basolateral endocytosis, apical or basolateral exocytosis, apical to basolateral transcytosis and basolateral transcytosis and basolateral transcytosis. Diseases treatable by gene therapy include monogenic diseases such as X-linked severe combined immunodeficiency, ADA deficiency (ADA-SCID), cystic fibrosis, Haemophilia by chematoid arthritis, pathogenic disorders, including human communodeficiency virus (HIV), viral infections, hepatitis, non-specific bacterial infection, tuberculosis, Herpes, Chlamydlosis and castrointestinal ulcer. The present sequence represents a human copular ecoptor (PIGR) peptide which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antipsoriatic; antiinflammatory; neuroprotective; ophthalmological; gastrointestinal; osteopathic; nephrotropic; gene therapy; multimeric molecular complex; transcytotic transport; garacellular transport; calcitonin; osteoporosis; renal failure; colitis; gastroenteritis; inflammatory bowel disease; psoriasis; Alzheimer's disease; optic neuropathy; ophthalmoplegia; polyimmunoglobulin receptor; plgR targeting element; endocytosis;
                                                                                                                                                                                                                                                                                                                        Fusion protein which confers the ability to penetrate epithelial cell layer and to undergo paracellular transport, has a transepithelial delivery element and a transmembrane domain from different proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                              The invention describes a multimeric molecular complex comprising at least 2 compounds, each of which has at least one targeting element directed to a ligand that confers transcytotic or paracellular transporting properties to a molecular complex specifically bound to the ligand. Also described are: a compound comprising at least 2 targeting elements directed to the ligand; a protein conjugate comprising a composition composition to the ligand; a protein conjugate comprising a composition discase in an animal; transporting a biologically active agent to an animal; transporting a biologically active agent through an epithelial barrier; treating a disease in an animal; and identifying a disease in an animal; and identifying a disease in an animal; and identifying a composition confits, asserted to the ligands, renal failure, colitis, gastroenteritis, inflammatory bowel disease, psoriasis, colitis, astroenteritis, inflammatory bowel disease, postianis, and composition confits, as conserved peptide from the polyimmunoglobulin receptor (pigs) that mediates endocytosis, exocytosis and forward and conserved transcytosis in epithelial cells, joined by a myc sequence to a

This invention relates to a novel method of treating or preventing a lung disease in a subject which comprises administering to the subject via a sulfact which comprises administering to the subject via a cultumnarry, oropharyngaeal or masopharyngeal route a compound comprising a therapeutic agent and a targeting element directed to a ligand, where the targeting element confers apical to basolateral transcytosis to the terapeutic agent in an in vitro transcytotic assay. The therapeutic agent in an in vitro transcytotic assay. The therapeutic agent in an in vitro transcytotic assay. The therapeutic confers in the method may have antimicrobial, antitubercular, the method individe, antitubercular, the method of the invention is useful for confersion, an infection of the lung, or a bacterial infection that causes tuberculosis, a viral infection that causes severe acute respiratory tract infection, an infection that causes pneumonia, a disorder of the interstitium, a disorder of gas exchange or blood circulation, a disease of the airways, a disorder of the pleura, Chronic Obstructive Pulmonary Disorder (COPD) or asthma. The present sequence is that of a peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating or preventing a lung disease comprises administering to the subject a compound comprising a therapeutic agent and a targeting element directed to a ligand.
                                   bacterial infection; tuberculosis; viral infection;
severe acute respiratory syndrome; SARS; fungal infection; pneumonia;
interstitium disorder; gas exchange disorder; blood circulation disorder;
airway disease; pleura disorder; Chronic Obstructive Pulmonary Disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Disorder (COPD) or asthma. The present sequence is that of a peptide which may be used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide #6513 encoded by human foetal liver single exon probe.
antiasthmatic; respiratory tract infection; lung infection;

Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements) fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                    Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
histiocytosis, lymphangioleiomyomtosis, pulmonary alveolar proteinosis,

Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples.

Claim 27; SEQ ID NO 31716; 634pp; English

The invention relates for a spatially addressable set to an appearant to an uncleic acid probes for measuring sexon nucleic acid probes for measuring sexon nucleic acid probes having one of from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid probes national and the light of probes. Also included are a microarray comprising the novel set of probes included are a microarray comprising the novel set of probes included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung, measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung array; identifying exons in a ewkaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included to the above mentioned microarray; assigning exons to a single exon comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in the exons in the specification, or a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that the exons should be assigned to a single gene; a peptide comprising one of 1201 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORP). The probes are used for gene expression of ung derived mNA and for the study of lung diseases uch as asterma, lung cancer, chronic obstructive pulmonary disease (CDD), interstitial lung derived mRNA and for the sequence of lung desages undicated and single exon contains sclerosis, and for identifying exons in a gene, particular Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary invention relates to a spatially-addressable set of single

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human brain expressed single exon probe encoded protein SEQ ID NO: 31341.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention
Alzheimer's disease; multiple sclerosis; schizophrenia; epilepsy; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; liver; cirrhosis; hyperlipoproteinaemia; hyperlipidaemia; hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                The invention relates to a single exon nucleic acid probe (SENP) (1) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (1) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47346-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent doses not appear in the printed specification but was obtained in electronic format directly from WIPO at
                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human peptide encoded by genome-derived single exon probe SEQ ID 31254
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; single exon probe; asthma; lung cancer; COPD; ILD; chronic obstructive pulmonary disease; interstitial lung disease; familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease; Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histocytesis; lymphangiolejomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasis; primary ciliary dyskinesis; pulmonary hypertension; hyaline membrane disease.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes with the last detectably bound to each probe of the derivation of detectably labeled nucleic acids derived from human lung comprising (a) contracting the array with a collection of detectably labeled nucleic acids derived from human lung array; identifying exons in a least one exon from genomic sequences of the extrayote; and (b) detecting specific hybridisation of detectably, abeled nucleic acids from eukaryote lung mkNA, to a single exon probe, and (b) measuring the expression of sequence by the method in the above mentioned microarray; assigning exons to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising one crypession of the exons in the tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; particularly using human composes, probes/open reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human compensation of the exons selecteds data exone in a gene, particularly using human compensations of the such selecteds data for the sudy of lung desases such as asthma. The propess are used for gene expression analysis, and for identifying exons in a gen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                Spatially-addressable set of single exon nucleic acid probes, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 LRKED 5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 40 AA;
```

```
The invention describes an isolated mucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidermidis polypeptide with any of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as CG given in the specification. Also described are: a recombinant expression vector; a call comprising a recombinant expression vector of (1); producing an S. epidermidis polypeptide, an isolated nucleic acid comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis of infection, comprising a nucleic acid cited above and a carrier; treating a subject for S. epidermidis infection; a recombinant or substantially pure preparation of an S. epidermidis polypeptide or its fragment; a vaccine composition for prevention or treatment of an S. epidermidis of infection; detecting the presence of a Staphylococcus mucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide system for identifying fragments of the Staphylococcus genome of commercial importance; a computer based system for identifying fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the staphylococcus staphylococcus spanner; and identifying an expression modulating fragment is an and/or plasmids; and identifying an and/or plasmids; and infentifying and and/or plasmids; and identifying and and/or plasmids; and intentions and/or plasmids; and intentifying and and/or plasmids; and infentifying and and/or plasmids; and and and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 compositions of the present invention are useful for the diagnosis, prevention and/or treatment of an Staphylococcal epidermidis bacterial infection. This is the amino acid sequence of a S. epidermis protein of
antibacterial; vaccine; antisense therapy; Staphylococcus epidermidis; recombinant expression vector; infection; computer readable medium;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polypeptide and encoding nucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            100.0%; Score 25; DB 8; I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a partial sequence encoded by exon 4 of the human INSP030 gene. INSP030 is a novel secreted protein which is a member of the insulin-like growth factor binding protein (IGFBP) family. A full-length protein sequence for INSP030 is given in ABR62389. The invention provides novel INSP030 and INSP031 secreted proteins, nucleic acids encoding them, and compounds that increase or decrease their expression or activity, especially a substrate, ligand, enzyme, receptor or mimetic. These are useful for diagnosing or treating a disease, such as a cell cor proliferative, autoimmune/inflammatory, cardiovascular disorder, neurological, developmental, metabolic or reproductive disorder, infection, growth disorder (e.g. growth hormone deficiency, acromegaly, intrauterine growth retardation, macrosomia), tumourigenesis and cancer (e.g. breast cancer), diabetes and its complications (e.g. diabetic kidney disease), chronic renal failure, vascular disease, asthma, catheroselerosis and restenosis, or other pathological condition (all claimed vaccine compositions. Claimed non-human canned in a naimals can be used to screen for a compound effective to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                22-AUG-2000
The invention relates to isolated polynucleotide (I) and polypeptide (II)

caedion (PCR) primers, oligomers, and for chromsome and gene mapping,

cand in recombinant production of (II). The polynucleotides are also used

in diagnostics as expressed sequence tags for identifying expressed

conditions of (II) or to treat disease states involving (II). (II) is

cuseful for generating antibodies against it, detecting or quantitating a

cupplement. (II) and its binding partners are useful in medical imaging

consistent and protein expression or biological activity. The

colypeptide and polynucleotide sequences have applications in

clasquostics, for generic disorders or other traits to assess biodiversity

and to produce other types of data and products dependent on DNA and

amino acid sequences of the invention. Note: The sequence data for this

canino acid sequences of the invention. Note: The sequence data for this

canino acid sequences of the printed specification, but was obtained in

calectronic format directly from WIPO at

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM8170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
cyression by rectifying mutations or deletions in a patient's genome
expression by rectifying mutations or deletions in a patient's genome
cypression by rectifying mutations or deletions in a patient's genome
cyplement the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
polynucleotides may be used to produce the secreted (I), by inserting the
concleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
chagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK84950 and AAM82169
represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                     Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ä

streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABMS6044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a
          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB77377-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptococcus; GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antiinflammatory; infection; vaccine; meningitis; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a protein (ABP25413-ABP30895) from group B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fraser C;

                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                       This invention describes novel human nucleic acid (CDNA) sequences (A), that are highly expressed in uterine tumour tissue and which have anticancer and cytostatic activity. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of uterine or endometrial cancer; (ii) directly for treating these forms of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent different corrurence in a particular tissue. ANY59941-Y60328 represent protein tragments encoded by the human endometrium tumour cDNA library derived ESTS fragments encoded by the human endometrium tumour cDNA library derived
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                      New nucleic acid sequences expressed in uterine cancer tissues, and derived polypeptides, for treatment of uterine and endometrial cancer and identification of therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more
genes from Drosophila and for elucidating cell signaling and cell-cell

ABN15762 to ABN27552 encode the human ORFX proteins given in ABPRO1010 to ABPR1500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperporliferative disorder; psoritasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes substantially purified human proteins

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) cupled acids into a host cell and culturing the cell to express the proteins and polynucleotides may be used to produce the secreted (I), by inserting the cucleic acids into a host cell and culturing the cell to express the proteins and polynucleotides may be used to prevent.

Conners and cancer metastesses of haematopoietic-related diseases, especially cancer metastesses of haematopoietic-derived cells. AAK64703 cancers and cancer metastesses of haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK8759 and AAM82169 cepresent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 11; SEQ ID NO 10650; 3071pp + Sequence Listing; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rosen CA, Barash SC, Ruben SM;

WPI; 1998-506364/43.

New isolated human genes and the secreted polypeptide(s) they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.

Disclosure; Page 103; 721pp; English.

This sequence represents a fragment of a secreted human protein encoded by the nucleic acid molecule designated Gene 166 (AAV59676). The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAM74731-W7026) which are useful for protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides.

Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for

```
The invention relates to an isolated protein that is one of 186 human secreted proteins, given in the specification, encoded by one of 309 cDNA sequences also given in the specification. The protein is used in a condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiovascular disorders e.g. cardiovascular disorders infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound can bealthalial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, coffactors and other nutritional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                       New isolated human secreted protein for diagnosing, preventing, treating or ameliorating medical conditions and used as a food additive or

New genes and its encoded prostate cancer antigen proteins, useful for preventing, treating, ameliorating or diagnosing e.g. prostate cancers, thymic hypoplasia, multiple sclerosis, AIDS, angina pectoris or cerebral ischemia.

Claim 3; Page 89; 260pp; English.

The present invention relates to the isolation of novel human secreted

```
producing human secreted proteins. The polypeptide and recombinant methods for producing human secreted proteins. The polypeptide and polynucleotide sequences for the secreted proteins. The polypeptide and polynucleotide sequences for the secreted proteins. The polypeptide and polynucleotide and polynucleotide analiozating, treating, ameliozating or diagnosing medical conditions such as hyperproliferative disorders (e.g. leukaemia or breast cancers), wounds, reproductive thrombocytopaenia), immunodeficiencies (e.g. haemophila or thrombocytopaenia), immunodeficiencies (e.g. graft-versus-host disease, thymic hypoplasia), autoimune disorders (e.g. graft-versus-host disease, thymic hypoplasia), autoimune disorders (e.g. graft-versus-host disease, viral or bacterial or fungal infections (e.g. ALDS or sepsis), renal disorders (e.g. kidney fallure), cardiovascular disorders (e.g. angina pectoris, cerebral ischaemia or congenital heart defects), respiratory calsorders (e.g. Alzheimer's disease or pertoris disease), and inflammations (e.g. Alzheimer's disease). The polynucleotide or polypeptide may also be used as vaccine adjuvants.

Charles and sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format directly from the constant of the printed specification, but was obtained in alectronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
 proteins and the polynucleotide sequences encoding them. The invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an isolated nucleic acid comprising a sequence having 95 % identity with: a polynucleotide fragment of a sequence not given in the specification, or its allelic variant; a polynucleotide fragment of the cDNA sequence; a polynucleotide sequence encoding a polypeptide, or its fragment, domain, epitope or species homologue; or a polynucleotide that hybridises under stringent conditions to any one of the sequences of (a)-(0). The nucleic acid is useful for preparing a medicament for diagnosing, preventing, treating or ameliorating a medicament for any one of condition e.g., cancer. The is the amino acid sequence of a fragment of a novel human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Isolated nucleic acid molecules encoding human secreted proteins, useful for preventing, diagnosing and treating disorders associated with aberrant expression and activity.

The invention relates to isolated nucleic acid molecules and the human secreted proteins (SPs) they encode. The proteins and nucleic acids may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate SP expression e.g. cancer, haematopoietic disorders, endocrine disorders, diseases of the immune system, inflammatory prevented, diagnosed and/or treated by the above methods are given in the specification. The nucleic acid molecules may be used to produce their proteins. The nucleic acid and it's complementary sequences may also be

The DNA sequences can be detected by contacting a sample with nucleic acid primers that anneal to the DNA and amplifying a product comprising a portion of the sequence. Detection of the product indicates the presence of DNA. The protein sequences can be detected by contacting a sample with a compound that binds to the polypeptide to form a complex. Detection of the complex indicates the presence of the protein. The sequences of the invention are useful for treating a subject having a need to inhibit activity or expression of IGFBP-like sequences. This
used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The SPs may also be used as antigens in the production of antibodies against the proteins and in assays to identify modulators of SP expression and activity. The anti-SP antibodies and antagonists may also be used to down requlate expression and activity. The anti-SP antibodies may also be used as diagnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The present sequence represents the amino acid sequence of a human secreted protein fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Insulin-like growth factor binding protein; IGFBP; human; cancer; female reproduction; embryo development; food supplement; gene mapping; medical imaging; autoimmune disease; nervous system disease; cytostatic; cerebrovascular disease; cund healing; gynaecological; antiinfertility;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New insulin-like growth factor binding protein-like polypeptide and encoding polynucleotides, useful for treating cancer, infertility, and arthritis, and for increasing wound healing.
                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                              ö
involves administering an antagonist of the polypeptide, a polynucleotide that inhibits the expression of the nucleotide sequence or a therapeutic amount of the polypeptide that competes for its ligand and a carrier. The sequences are useful in treatment of disorders such as cancer, or to promote female reproductive health and embryo development. They can also be used in food supplements, in medical imaging and in gene mapping. The sequences can be used in the treatment and prevention of autoimmune diseases, nervous system diseases, cerebrovascular diseases and infertility and for enhancing wound healing. This sequence represents a human IGPBP-like polypeptide
                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a new pharmaceutical composition comprising an anti-cell surface antigen (CSA) consisting of CD84Hyl, alpha2MHy, IgFBP-MHyl, Toll-like receptor 9 (TLR9) or VpreBl, antibody specific for cells that cause a disease e.g., 8-cell lymphoma, where the antibody specifically binds to a polypeptide having an amino acid sequence not
diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cytostatic; immunosuppressive; gene therapy; anti-cell surface antigen; CD84Hyl; alpha2MHy; IgFBP-7Hyl; Toll-like receptor 9; VpreBl; antibody; Iymphoma; cancer; autocimmune disorder; systemic lupus erythematosus; pericarditis lupus; Sjoegren's syndrome; Hashimoto thyroiditis; transplanted tissue rejection; carcinoma; leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New pharmaceutical composition comprising an anti-cell surface antigen consisting of CD84Hyl, alpha2MHy, IgPBP-THyl, Toll-like receptor 9 or VpreBl antibody, useful for diagnosing or treating e.g., cancer or autoimmune disorders.
                                                                                                                                                                                                                                       Gaps

given in the specification or its extracellular portion. The pharmaceutical composition is useful for diagnosing or treating cancer, autoimmune disorders, systemic lupus enythematosus, pericarditis lupus, sjoegren's syndrome, Hashimote thyroiditis or rejection of transplanted tissues or organs. This sequence corresponds to a protein used in the invention. (Note: The sequence data for this patent did form part of the printed specification, but was obtained in electronic format directly form NIPO at ftp.wipo.int/pub/published_pct_sequences).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulin; signal transduction pathway protein; cancer; antisense therapy; gene therapy; neurological disorder; renal disorder; cardiovascular disorder; gastrointestinal disorder; pulmonary disorder; reproductive disorder; immune system disorder; proliferative disorder;

Sequences AAU17977-AAU18087 represent immunoglobulin polypeptides of the invention. The polypeptides and their associated polymucleotides can be used to diagnose a pathological condition or a susceptibility to a pathological condition in a subject by determining the presence or absence of a mutation in a DNA sequence or determining the presence or amount of expression of the protein. Alternatively the identification of a binding partner to a sequence allows determination of changes in protein activity. The sequence allows determination of changes in protein activity. The sequences can be used as research tools for receptors or other signal transduction pathway proteins that interact with the polypeptides of the invention and can be used to treat, prevent or diagnose various types of disorders such as neurological disorders, cardiovascular disorders, gastrointestinal disorders, reproductive disorders, immune system disorders, renal disorders, muscular disorders, pulmonary disorders, proliferative disorders and cancer. Note: The pulmonary disorders, proliferative disorders and cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at they wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated novel immunoglobulin polypeptide for monitoring the presence and progression of diseases and for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match 100.0%; Score 25; DB 4; Length 105; Best Local Similarity 100.0%; Pred. AAX54951 to AAX64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM8170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
cytoteins and polymuclectides may be used in the prevention, diagnosis and
cxample, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
cxpression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
cypuedleotides may be used to product on (I). Additionally, (I)
cypuucleotides may be used to produce the secreted (I), by inserting the
nucleic acids into a host cell and culturing the cell to express the
cyptemen. (I) proteins and polymucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of heematopoietic-derived cells. AAK64703
cc cancers and cancer metastases of heematopoietic antigen genomic
sequences from the present invention. AAK49492 to AAK64950 and AAM82169
crepresent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; gene therapy; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; pulmonary disorder; cardiovascular disorder; renal disorder; proliferative disorder; inflammation.

                                                                                            The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                             Human; nootropic; neuroprotective; cytostatic; dermatological; virucide; immunosuppressive; antiinflammatory; anti-HIV; antibacterial; vulnerary; antiparkinsonian; antiachtritic; cancer; antirheumatic; hepatotropic; cerebroprotective; antiinflammatory; antiallergic; antidiabetic; antiulcer; anticorvulsant; antifungal; antiparasitic; cardiant; immune disorder; cardiovascular disorder;
                                    Isolated nucleic acid molecule encoding an inflammation-associated polypeptide is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                              Gaps

The invention relates to novel genes (ABV83682-ABV84101) and proteins (ABP66710-ABP67129) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and observant or and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune hacmolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, cancemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, and interior acidiovascular disorders such as wyccardial ischaemias; (d) wound healing cardiovascular disorders such as wyccardial ischaemias; (d) wound healing confections diseases e.g. cerebral anoxia and epilepsy; and (f) infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel polypeptide useful for diagnosis, prognosis, prevention, treatment of immune, hyperproliferative, renal, respiratory, cardiovascular, reproductive, endocrine, gastrointestinal and neurological disorders.

"Human bies gecretory component is composed of the first 585 amino acid residues of the polymeric immunoglobulin receptor.";
FEBS Lett. 410:443-446(1997).
-!- FONCTION: This receptor binds polymeric IgA and IgM at the basolateral surface of epithelial cells. The complex is then transported across the cell to be secreted at the apical surface. During this process a cleavage occurs that separate the extracellular (known as the secretory component) from the transmembrane segment.
-!- SUBCELLULAR LOCATION: Type I membrane protein. Also secreted.
-!- SIMILARITY: Contains 5 immunoglobulin-like V-type domains.
                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE OF 19-577.
